## PROPER CARE OF PLANT MATERIAL

Upon receiving any plant material from us, it is important to remember that these plants are living and require regular care. Here are a few tips to ensure success in the maintenance of your bare-root and potted plant material.

- **DO NOT** allow your plants to dry out. Water thoroughly and regularly. Be very careful that you do not over-water.
- Cover all roots of bare-root material with moist peat moss or other loose mulch and keep plants stored in well sheltered area.
- Place newly potted plant material in a protected area such as a lath house until bud break. Maintain high humidity to promote bud break.
- Provide wind protection for established potted material to minimize drying out and blow down.
- Protect budding plant material when the temperature goes below the freezing point. Tender material should be brought indoors or laid down and covered with a tarpaulin until the risk of frost is past.
- Water more frequently when the temperature rises about 25°C (77°F). Black pots and black fabric absorb heat and will result in an increase in soil temperature.
- Fertilize your potted material in early June. We put fertilizer in our pots the previous April and this will maintain the plant up to the month of June. Adding a slow release fertilize in early June will keep your plant material healthy and saleable throughout the remainder of the season.

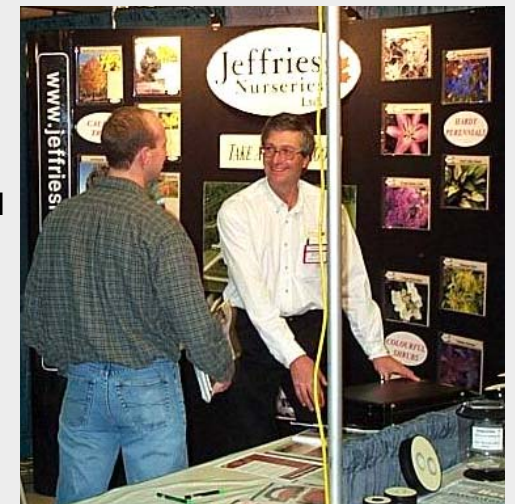

## TRADESHOWS

**Prairie East Horticultural Trade Show** (Booths 63 & 64)  
 November 5<sup>th</sup> & 6<sup>th</sup>, 2003
